

Abstract

*Ans a 3*

In a car radio having a handset (6) that is inserted into a horizontally positioned holder (5) in a front panel (1) and has a screen (10) as well as labeled control keys (13, 15, 16) and can be used as the control unit for a car radio or as a telephone, the use of the handset (6) is made easier in both operating positions by orienting the labeling of the control keys (13, 15, 16) along an axis (17) that is rotated out of the usual perpendicular alignment of the handset (6) in the mounted position by an angle between 30 and 60 degrees in the direction of the longitudinal axis (18) of the handset (6), thereby making the labeling easy to read in both operating positions of the handset (6).
